Professional Summary

Recent Computer Science graduate seeking internship and entry-level opportunities in data analytics, machine learning, software engineering, and backend development. Portfolio projects demonstrate Python data preparation, Power BI reporting, scikit-learn regression and text classification, and tested web applications built with Java, Spring Boot, JavaScript, HTML, and CSS.

Technical Skills

Languages: Python, SQL, Java, JavaScript, HTML, CSS

Data and Business Intelligence: pandas, Power BI, DAX, data cleaning, data quality testing, Matplotlib

Machine Learning and NLP: scikit-learn, gradient boosting, regression, interval calibration, TF-IDF, logistic regression, confidence thresholds, model evaluation

Backend, Web, and Tools: Spring Boot, REST APIs, browser storage, Git, GitHub Actions, Vercel, pytest, JUnit, Node.js test runner

Projects

Electronics Storefront and Order Management System

June 2026

GitHub: github.com/harikareddy9878-rgb/bigtech-electronics-store

- Built an electronics shopping website to keep product search, stock, cart, payment results, delivery tracking, order history, and customer support connected through one customer journey.
- Used JavaScript, HTML, CSS, Java 17, Spring Boot, REST APIs, and Vercel for 28 products and seven categories; implemented three checkout outcomes and eight delivery stages, verified by 17 automated tests.

Public Service Request Classification and Routing

March 2026

GitHub: github.com/harikareddy9878-rgb/civicroute-service-request-triage

- Built a text-classification system that directs written public service requests to eight service queues while sending uncertain requests to manual review instead of forcing a prediction.
- Used Python, pandas, TF-IDF, and logistic regression to prepare 175,784 source requests into 36,805 examples; achieved 0.974 macro F1, 84.8% automatic coverage, and 99.9% accepted-route accuracy.

Indian Metro Rental Price Estimation

December 2025

GitHub: github.com/harikareddy9878-rgb/metrorent-price-estimator

- Built a rental-price model for five Indian cities to estimate monthly asking rent while showing an uncertainty range instead of presenting one value as guaranteed.
- Used Python, pandas, scikit-learn, and gradient boosting to clean 21,691 listings into 12,201 model rows; reduced MAE to INR 11,652 from an INR 22,122 baseline and achieved 89.7% interval coverage.

Public Health Facility Data Quality and Analytics

May 2025

GitHub: github.com/harikareddy9878-rgb/caremap-facility-analytics

- Cleaned a large public health-facility directory so duplicate facilities, invalid coordinates, and inconsistent state labels would not distort national and state comparisons.
- Used Python and pandas to turn 200,438 source records into 193,783 validated rows, then used Power BI and DAX for a four-page analysis of coverage, facility mix, and data quality.

Education

Bachelor of Technology in Computer Science

Graduation: June 2026

Institution: [add institution name], India
